

HomeBandhu

Rough Features (For Now)

1. User login and authentication (RBAC)
2. Amenity booking (request from resident; approve/reject from admin side)
3. Resident dashboard
4. Admin dashboard
5. Auto Refresh/Realtime Data Update (Dynamic Hydration <check nextjs/astro docs>)
6. Partial Cancellation of Multi-Day Bookings — Allows administrative staff to cancel one or more individual dates within a multi-day amenity booking while preserving the remaining reservation dates.
7. Complaint management (with LLM Agent Support, creation from user dashboard, action from dashboards of workmen, monitoring from admin dashboard; some systematic task assignment; schedule negotiation between resident and service personnel)
8. Visitor management (sending approval requests from security personnel dashboard, approvals from resident dashboard, monitoring from admin dashboard)

Amenity Booking Ideas

1. If an user books a schedule with a service person for a specific service in a specific timeslot of a day, that person is not available to anyone else for that [timeslot](#). He is free after that jobs is marked as completed.
2. Once the user lodges the complaint, the system searches for available personnel offering that service and is available during the timeslot. It shows a list of available servicemen. The user selects one person and has the ability to negotiate timing schedule and payment(the user might say that i am available at this time but the serviceman says that he will be available a bit later, the user and serviceman can go back and forth negotiating and finally arriving at an agreement and the service is book successfully). If the user and service person cannot hashout timing and payment, the user skips that service person and selects another serviceman. If no service man is available the admin is informed and he can then deal with this situation one on one with the user.
3. if the available persons do not wish to take up the service request or no serviceperson is able to successfully negotiate with the user, the user will be auto-assigned a service person from the available servicemen pool for that job at the user's preferred timing.
4. Once the service has been scheduled -> maintenance team (utilities) -> dashboard:
 - a. Jobs assigned for the day - top portion
 - b. Priority jobs
 - c. Section for selecting time availability and jobs (roster)

5. Once they arrive, they update on their end (utility)
6. After job (they upload images) and or otp from user.
7. STAGES OF COMPLAINT:
 - Submitted
 - Read (by n number of service person, populate the value of n dynamically (optional))
 - Analysing
 - Service request raised (optional)
 - Maintenance scheduled (optional)
 - Resolved

VISITORS:

1. Resident will

WORST CASE SCENARIO

VISITOR - > SECURITY asks number -> otp ? -> otp and the phone number for validity of otp

otp-> no -> asks for number -> name of visitor -> push notification to you -> you approve or reject -> this gets communicated to the security

NORMAL LOGIC:

Optional (pic of visitor), saved profiles of visitors

1. You have sent otp already
 - a. Send otp to the visitor as sms
 - b. List of otps and visitor names on server
 - c. Updated on security dashboard (with expiries)
 - d. When visitor arrives (checked for otp)
2. You have not scheduled otp
 - a. Visitor name and your number
 - b. Entered on security dashboard
 - c. It sends a push notification to you on your device
 - d. Approve or reject (push notification)

POLICIES:

Implementing new policies :

Poc and implementation : admin (secretary) -> update or addition

Admin Page :

- a. Optional drop down -> article or section reference
- b. Body of policy (text box)
- c. Date of effect
- d. Checkbox (immediate)
- e. Button (publish)

Others Page:

- a. Push notification for the latest update (with a checkbox for read)
- b. If read toggle in db and don't show again
- c. If not read, show again on new homepage loading
- d. Historic notifications can be seen via updates center (icon on dashboard)
- e. If later date of effect, push notification on day before and day of effect -> can have custom toggle for notification schedules for policies

Include static page for policies

Entities/Roles

1. Customer
2. Administrator (for example, secretary of the society, managers)
3. A Role for each serviceman (utilities)
4. Security

Adding a User - Resident registration

1. Admin adds a resident via his dashboard
2. He has the option to add one or multiple numbers for a single apartment or address.
3. On adding the details and confirming, it generates a hash and a link with the hash.
4. The hash can be shared with the user along with the link.
5. The resident can either enter his or any of the numbers in the login screen and the login screen would ask for a hash
6. Alternatively, they can click on the link and they will be directed to the dashboard.
7. If any one of the numbers in the list for an apartment is registered using link or hash, all the other numbers are assumed to be registered. *(alternatively they can each have a hash and link)*
8. The user should also be able to add other numbers to his residence via his dashboard without admin interference.
